CRM System Upgrade: Salesforce Build (Phase 1)

A personal Business Analyst portfolio project. I took a CRM Business Requirements Document (BRD), built the most important requirements in Salesforce, tested them against user stories, and documented everything.

> **Sample data only.** North Texas Solutions is a sample company. All accounts, contacts, deals and cases are made up for practice. This is not client work.

The problem

A small, growing company is moving its sales and service team off spreadsheets and email onto its first CRM. Today:

- Managers can't see the sales pipeline in one place.
- Sales reps can give any discount, with no review.
- Customer issues get lost in inboxes.
- Reports are built by hand every week.
- Everyone can see every deal's value.

What I built

Business need	What I built in Salesforce
One customer record	Accounts and contacts linked together, plus an **Industry Segment** field
Track leads and deals	Lead conversion (lead to account, contact and deal in one click) and a **Kanban pipeline** by stage
Control discounts	A **validation rule** that blocks discounts over 40%, and a **Flow** that flags discounts over 20% and creates a High priority "Review discount" task for the deal owner
Handle customer issues	**Cases** with priority and status, and an **Open High Priority** list view
Live reporting	3 reports and a **Sales & Service Overview** dashboard
Keep deal values private	**Private** sharing for opportunities and a role hierarchy (CEO > Sales Manager > Sales Rep)

Everything is built with standard Salesforce configuration (no custom code).

Scope decisions

My BRD had 10 requirements ranked with MoSCoW. Phase 1 delivers 6 of them.

Requirement	Priority	Phase
FR-001 Customer data, FR-002 Pipeline, FR-003 Reporting	Must Have	**Phase 1**
FR-006 Workflow automation, FR-007 Cases, FR-008 Custom fields	Should Have	**Phase 1**

Requirement	Priority	Phase
FR-004 Marketing integration, FR-005 Offline mobile	Must Have	Phase 2 (needs outside systems)
FR-009 Documents, FR-010 ERP integration	Could Have	Phase 2

How I tested it

I wrote **9 user stories** with Given / When / Then acceptance criteria and ran **11 test cases**, including negative tests (for example, a 15% discount must *not* trigger a review).

3 defects found and fixed:

1. **Flow wouldn't activate.** The task's "Assigned To" pointed at the whole record instead of the owner field. Fixed the mapping.
2. **Open cases report showed 4, not 3.** The report filter was right; the test case had never been closed. Enabled closed statuses and closed the case.
3. **Pipeline KPI showed $205,000.** It included won and lost deals. Built an "Open Pipeline" report (deals not closed): **$163,000**.

Results

Measure	Result
Custom fields	3
Sample records	26 (6 accounts, 6 contacts, 3 leads, 7 deals, 4 cases)
Automation	1 validation rule, 1 record-triggered Flow
Reporting	3 reports, 1 list view, 1 dashboard
Tests	11 passed
Defects	3 found, 3 fixed
Open pipeline	$163,000 across 5 deals

Files in this folder

File	What it is
01_CRM_BRD.docx	Business Requirements Document: the problem, goals, scope, stakeholders, requirements
02_CRM_FRD.docx	Functional Requirements Document: exact fields, rules, Flow, reports and security settings
03_CRM_User_Stories_and_Acceptance_Criteria.docx	User stories, test cases and defect log
04_CRM_Business_Process_Model.docx	As-is vs to-be, and two BPMN swimlane diagrams
05_CRM_Salesforce_App_Build.docx	What was built, part by part, with screenshots
Diagrams/	BPMN process diagrams (PNG)
Screenshots/	Evidence from the Salesforce org

What's next (Phase 2)

- Marketing integration and offline mobile access
- A due date on the review task, and a formal approve/reject process
- Log in as a test Sales Rep to prove privacy end to end

- Flag older deals that were already over 20% before go-live
